

Module 28 - Self-invoked Functions & Closures

1. What is a Self-invoked Function (IIFE)?

A Self-invoked Function, also called an IIFE (Immediately Invoked Function Expression), is a function that executes immediately after it is created, without calling it separately.

Example Code:

```
// Executes immediately
(function (userName, age) {
    console.log("Self-invoked Function", userName + age);
})("Deveeswar", 23);
```

2. What is Closure?

A closure is a function that remembers and can access variables from its outer function even after the outer function has finished executing.

Example Code:

```
// Outer function
function outerFunction() {
    // Outer variable
    let outerVariable = "I'm from outer scope";

    // Inner function
    function innerFunction() {
        console.log(outerVariable);
    }

    // Return inner function
    return innerFunction;
}

// Store returned function
let innerFun = outerFunction();

// Call inner function
innerFun();
```
